

⇒ analogRead command.

- Used to read a value of voltage across a component.
- To print, we use `Serial.begin()` in `void setup()` {
baud rate, how quickly you talk to
Serial Monitor.
- To print value of voltage, we use `Serial.println(V2);`
- We use serial monitor to ~~get~~ see the voltage.
- voltage seen is usually greater because there are 1023 bits for voltage read.

$$0 - 1023 \rightarrow 2^{10}$$

V

R.V.

0

0

5

1023

$$V2 = \left(\frac{5}{1023} \right) \times \text{Read value}$$
